

Ecological site R040XB220AZ Granitic Upland 7"-10" p.z.

Accessed: 05/10/2025

General information

Provisional. A provisional ecological site description has undergone quality control and quality assurance review. It contains a working state and transition model and enough information to identify the ecological site.

Figure 1. Mapped extent

Areas shown in blue indicate the maximum mapped extent of this ecological site. Other ecological sites likely occur within the highlighted areas. It is also possible for this ecological site to occur outside of highlighted areas if detailed soil survey has not been completed or recently updated.

MLRA notes

Major Land Resource Area (MLRA): 040X–Sonoran Basin and Range

AZ 40.2 – Middle Sonoran Desert

Elevations range from 1200 to 2000 feet and precipitation averages 7 to 10 inches per year. Vegetation includes saguaro, palo verde, creosotebush, triangle bursage, brittlebush, prickly pear, cholla, desert saltbush, wolfberry bush muhly, threeawns, and big galleta. The soil temperature regime is hyperthermic and the soil moisture regime is typical aridic. This unit occurs within the Basin and Range Physiographic Province and is characterized by numerous mountain ranges that rise abruptly from broad, plain-like valleys and basins. Igneous and metamorphic rock classes dominate the mountain ranges and sediments filling the basins represent combinations of fluvial, lacustrine, colluvial and alluvial deposits.

Table 1. Dominant plant species

Tree	(1) <i>Parkinsonia microphylla</i>
Shrub	(1) <i>Ambrosia deltoidea</i> (2) <i>Eriogonum fasciculatum</i>
Herbaceous	(1) <i>Pleuraphis rigida</i> (2) <i>Muhlenbergia porteri</i>

Physiographic features

This site occurs on pediments, undulating uplands in and around the low desert mountains. Slopes range from 1% to 15%. Elevations are from 1000 to 2500 feet.

Table 2. Representative physiographic features

Landforms	(1) Pediment
Flooding frequency	None
Ponding frequency	None
Elevation	1,000–2,500 ft
Slope	0–15%
Aspect	Aspect is not a significant factor

Climatic features

Precipitation in the sub-resource area ranges from 7 to 10 inches. Elevations range from 900 to 2050 feet. Winter-summer rainfall ratios range from 40% to 60% in the southern part along the international boundary, to 60% to 40% in the central and northern parts of the sub-resource area. As one moves from east to west in this resource area rains become more unpredictable and variable with Coefficients of Variation of annual rainfall equal to 38% at Florence and 46% at Aguila. Summer rains fall July- September, originate in the Gulf of Mexico, and are convective, usually brief, intense thunderstorms. Summer precipitation is extremely erratic and undependable in this area. Cool season moisture tends to be frontal, originates in the Pacific and Gulf of California, and falls in widespread storms with long duration and low intensity. This is the dependable moisture supply for vegetation in the area. Snow is very rare and usually melts on contact. May-June is the driest time of the year. Humidity is very low.

Winter temperatures are very mild with very few days recording freezing for short periods of time. Summertime temperatures are hot to very hot with many days in June-July exceeding 105 degrees F. Frost-free days range from 280 at stations in major river valleys with cold air drainage to 320 to 350 days at upland stations.

Both the spring and the summer growing seasons are equally important for perennial grass, forb and shrub growth. Cool and warm season annual forbs and grasses can be common in their respective seasons with above average rainfall. Perennial forage species can remain green throughout the year with available moisture.

Table 3. Representative climatic features

Frost-free period (average)	350 days
Freeze-free period (average)	0 days
Precipitation total (average)	10 in

Influencing water features

Soil features

These are shallow and very shallow soils formed on acid and intermediate igneous parent materials and on sandstone, quartzite, arkose and gneiss. They are coarse textured, non-calcareous and have well developed gravel covers. Bedrock is usually slightly weathered into grus material at the soil juncture, and may be slightly calcareous. Rock outcrops make up a small percentage of soil units. Plant-soil moisture relationships are poor. This site is mapped in 7 Soil Survey areas in Southwestern Arizona on CRA D40-2.

Soils mapped on this site include: SSA-645 Aguila-Carefree area MU Vaiva-123; SSA-651 Central Maricopa county MU Gachado-GA; SSA-653 Gila Bend-Ajo area MU's Gachado XGrSL-40 and Quilotosa-53; SSA-658 Gila River Indian Reservation MU's Quilotosa-26 and Vaiva-26; SSA-659 Western Pinal county MU Vaiva-46; SSA-661 Eastern Pinal-Southern Gila counties MU's Ajolito-285 and Suncity-605; SSA-703 Tohono O'odham area Quilotosa-

50. Parent material kind includes resium also. Parent material origin includes rhyolite and gneiss.

Table 4. Representative soil features

Surface texture	(1) Gravelly sandy loam (2) Very gravelly loam
Family particle size	(1) Loamy
Drainage class	Well drained
Permeability class	Moderately slow to moderately rapid
Soil depth	4–20 in
Surface fragment cover <=3"	35–65%
Surface fragment cover >3"	1–10%
Available water capacity (0–40in)	0.2–1.6 in
Calcium carbonate equivalent (0–40in)	1–10%
Electrical conductivity (0–40in)	0 mmhos/cm
Sodium adsorption ratio (0–40in)	0
Soil reaction (1:1 water) (0–40in)	7.4–8.4
Subsurface fragment volume <=3" (Depth not specified)	35–65%
Subsurface fragment volume >3" (Depth not specified)	1–10%

Ecological dynamics

The plant communities found on an ecological site are naturally variable. Composition and production will vary with yearly conditions, location, aspect, and the natural variability of the soils. The Historical Climax Plant Community represents the natural potential plant communities found on relict or relatively undisturbed sites. Other plant communities described here represent plant communities that are known to occur when the site is disturbed by factors such as fire, grazing, or drought.

Production data provided in this site description is standardized to air dry weight at the end of the summer growing season. The plant communities described in this site description are based on near normal rainfall years.

NRCS uses a Similarity Index to compare existing plant communities to the plant communities described here. Similarity Index is determined by comparing the production and composition of a plant community to the production and composition of a plant community described in this site description. To determine Similarity Index, compare the production (air dry weight) of each species to that shown in the plant community description. For each species, count no more than the maximum amount shown for the species, and for each group, count no more than the maximum amount shown for the group. Divide the resulting total by the total normal year production shown in the plant community description. If the rainfall has been significantly above or below normal, use the total production shown for above or below normal years. If field data is not collected at the end of the summer growing season, then the field data must be corrected to the end of the year production before comparing it to the site description. The growth curve can be used as a guide for estimating production at the end of the summer growing season.

State and transition model

State 1 Historical Climax Plant Community

Community 1.1 Historical Climax Plant Community

The potential plant community on this site is a mixture of desert trees, shrubs, cacti and perennial forbs and grasses. Annuals are of minor importance in the plant community. The aspect is shrubland. With poorly managed grazing, perennial forage species like; desert trumpet, slender janusia, flattop buckwheat and bush muhly disappear from the plant community. Trees tend to be shrubby on this site due to soils shallow to bedrock. This site lacks the cobble and stone cover of adjacent hillslopes. Gravel size and cover may be lacking on moderate slopes to prevent water erosion. Plant populations for major species range from 40 to 100 trees per acre for paloverde and ironwood, 500 to 800 plants per acre for triangle bursage and white brittlebush, 1 to 10 saguaros per acre and 5 to 20 ocotillo plants per acre. Perennial plant basal cover on this site is very low from 1/2 to 1 percent.

Table 5. Annual production by plant type

Plant Type	Low (Lb/Acre)	Representative Value (Lb/Acre)	High (Lb/Acre)
Shrub/Vine	188	—	225
Tree	188	—	225
Forb	13	—	38
Grass/Grasslike	13	—	25
Total	402	—	513

	catclaw acacia	ACGR	<i>Acacia greggii</i>	0–1	–
9	Succulents			10–25	
	beavertail pricklypear	OPBA2	<i>Opuntia basilaris</i>	0–2	–
	Leconte's barrel cactus	FECYL	<i>Ferocactus cylindraceus</i> var. <i>lecontei</i>	0–2	–
	Emory's barrel cactus	FEEM	<i>Ferocactus emoryi</i>	0–2	–
	candy barrelcactus	FEWI	<i>Ferocactus wislizeni</i>	0–2	–

	senita cactus	PASC14	<i>Pachycereus schottii</i>	0–1	–
	organpipe cactus	STTH3	<i>Stenocereus thurberi</i>	0–1	–
	Engelmann's hedgehog cactus	ECEN	<i>Echinocereus engelmannii</i>	0–1	–
Tree					
8				50–75	
	desert ironwood	OLTE	<i>Olneya tesota</i>	20–35	–
	yellow paloverde	PAMI5	<i>Parkinsonia microphylla</i>	20–35	–

Animal community

Areas of this site are associated with steep, rough, hillsites. It will be overused unless grazing systems allow enough rest for recovery or fencing is used to isolate it from the adjacent mountains. This site produces no herbaceous forage and very little useable browse for livestock. Water will be available in bedrock canyons for short periods of time after heavy rainfall.

Water developments are very important to wildlife species on this site. Some free water may remain, after rains, for a few weeks in the rock lined drainages that bisect this site. Large mammals use the site seasonally unless permanent water supplies are available. Food, cover, diversity and some topography make this site home to a variety of desert animals. Desert tortoises den in rock crevices along drainage ways through areas of this site.

Other information

T&E: Antilocapra Americana sonoriensis
(Sonoran pronghorn)
Leptonycteris curasoae yerbebuena
(Lesser long-nosed bat)

Type locality

Location 1: Maricopa County, AZ	
Township/Range/Section	T7S R2E S4

Rangeland health reference sheet

Interpreting Indicators of Rangeland Health is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

Approval date	
Composition (Indicators 10 and 12) based on	Annual Production

Indicators

- 1. Number and extent of rills:** Rills are common and continuous in absence of high gravel cover. They commonly occur along bedding planes and joints in the bedrock parent material.

- 2. Presence of water flow patterns:** Discontinuous, 10-15 feet in length. Will see shorter flow paths with high surface coarse fragments.

- 3. Number and height of erosional pedestals or terracettes:** Shrubs have symmetrical mounds caused by the actions of splash, erosion and rodent activity. There are no pedestals on rock or gravel fragments and no terracettes are present.

- 4. Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground):** 10-60% (low values due to high rock and gravel cover)

- 5. Number of gullies and erosion associated with gullies:** None

- 6. Extent of wind scoured, blowouts and/or depositional areas:** None

- 7. Amount of litter movement (describe size and distance expected to travel):** Most litter size classes stay in place due to high rock and gravel cover.

8. **Soil surface (top few mm) resistance to erosion (stability values are averages - most sites will show a range of values):** No slake test done. Expect ratings of 1-3 in perennial plant interspaces, 4-5 under shrub canopies.
-
9. **Soil surface structure and SOM content (include type of structure and A-horizon color and thickness):** Weak granular to subangular blocky; color is 7.5-10YR5/4 dry, 7.5-10YR4/4 Moist; thickness to 4 inches.
-
10. **Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff:** Canopy 15-20%: 50% shrubs, 23% trees, 25% succulents and 1-2% perennial grass. Cover is well dispersed throughout site.
-
11. **Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site):** None
-
12. **Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):**
- Dominant: sub shrubs > trees > winter annuals > shrubs > summer annuals > perennial forbs > perennial grasses > succulents
- Sub-dominant:
- Other:
- Additional:
-
13. **Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence):** 2050% tree & shrub canopy mortality, 75-90% mortality on perennial grasses.
-
14. **Average percent litter cover (%) and depth (in):**
-
15. **Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annual-production):** 150 lbs/ac unfavorable precipitation; 250 lbs/ac normal precipitation; 350 lbs/ac favorable precipitation.
-
16. **Potential invasive (including noxious) species (native and non-native). List species which BOTH characterize degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not invasive plants. Note that unlike other indicators, we are describing what is NOT expected in the reference state for the ecological site:** Sahara mustard
-
17. **Perennial plant reproductive capability:** Not impaired for shrubs; drought impaired for perennial grasses and forbs.
