USDA Natural Resources Conservation Service

Ecological site F096XB026MI
Wet Floodplain

Last updated: 9/11/2024
Accessed: 05/10/2025

General information

Provisional. A provisional ecological site description has undergone quality control and quality assurance review. It contains a working state and transition model and enough information to identify the ecological site.

Figure 1. Mapped extent

Areas shown in blue indicate the maximum mapped extent of this ecological site. Other ecological sites likely occur within the highlighted areas. It is also possible for this ecological site to occur outside of highlighted areas if detailed soil survey has not been completed or recently updated.

MLRA notes

Major Land Resource Area (MLRA): 096X–Northwestern Michigan Fruit Belt

This area is dominated by outwash plains and moraines. Lake plains, till plains, drumlins, and sand dunes are found locally across the area. The terrain is steep on stream carved moraines, ice contact ridges, and sand dunes, and flat on outwash plains and lake plains. Elevation ranges from 177 to 369 m (580 to 1210 ft). Local topographic relief averages 11 m (35 ft) in the south to 20 m (65 ft) in the north and ranges up to a maximum of 158 m (520 ft) at Empire Bluff (Sleeping Bear Dunes). Much of the area rises sharply from the lakeshore to the adjoining hilltops. The Manistee River is the longest river in this area. Its trout fishery is maintained by constant inflow of cool ground water from the porous sand dominated landscape. The Pine and Pere Marquette Rivers also occur in this MLRA. Surficial topography are formed of glacial deposits except for local areas with dune building near Lake Michigan. Most of the bedrock surface is at or below the elevation of Lake Michigan, and is exposed in only in limited extents near Charlevoix. The bedrock, all Paleozoic in age, is the Traverse Group and the Dundee Limestone. These Silurian-Devonian rocks are mostly limestone and dolomite with some interbedded shale, chert, and anhydrite stringers. The drumlin belts in the northern portion of the area is the most affected by the limestone nearer to the surface in terms of carbonates in the till.

About two-thirds of this area is in small, privately owned holdings, and one-third consists mostly of State forests. The forests are used mainly for timber production and recreation. The growth of orchard crops and other crops and dairy and beef operations are important enterprises in the area. Forage and feed grains for dairy and other livestock

are the principal crops. Asparagus, wheat, oats, corn, and hay are commonly grown in the area. Orchard products include sweet and tart cherries, apples, plums, and peaches. The Manistee National Forest and Sleeping Bear Dunes National Lakeshore are among the more notable conservation lands in the area. Nordhouse Dunes Wilderness Area is within the Manistee National Forest. Sections of the Pere Marquette, Pine, and Manistee Rivers, and Bear Creek have been designated as National Wild and Scenic Rivers.

Summary of existing land use:
Upland Forest (52%)
Hardwood (38%)
Conifer (11%)
Agricultural (15%)
Swamps and Marshes (13%)
Developed (13%)

Classification relationships

According to the USFS (Bailey) system of ecoregions, the site is located mostly within 212Ha (Oceana Sandy Lake Plains and Dunes) and 212Hb (Manistee Sandy Outwash Plain) subsections. According to the EPA (Omernik) system of ecoregions, the site is located in 50ag (Newaygo Barrens) and northern 56d (Michigan Lake Plain) level IV ecoregions. This site is outside the environmental range of the Kotar system. This site corresponds to the Complex lowland ecological land type phases 50-59, in the USFS Ecological Land Type system.

Ecological site concept

The central concept of Wet Floodplain is lowlands adjacent to a river or stream, periodically flooded, sometimes of long duration during the growing season or with a high watertable, and capable of supporting hydric vegetation (poorly drained or wetter). Site in moderate annual snowfall belt, mostly south of Manistee River, where fire was locally important. Area has a more southern flora than sites further north. Vegetation trending towards floodplain forest.

Table 1. Dominant plant species

Tree	(1) *Acer saccharinum* (2) *Fraxinus pennsylvanica*
Shrub	(1) *Lindera benzoin*
Herbaceous	(1) *Matteuccia struthiopteris*

Physiographic features

Site is located on floodplains eroded through glacial till or outwash.

Table 2. Representative physiographic features

Landforms	(1) Flood plain
Runoff class	Negligible to low

Flooding duration	Brief (2 to 7 days) to very long (more than 30 days)
Flooding frequency	Occasional to very frequent
Elevation	577–1,201 ft
Water table depth	0–10 in
Aspect	Aspect is not a significant factor

Climatic features

Mean annual temperatures are 7.1 to 8.5 °C (45 to 47 °F). The warmest six months average 15.5 to 16.5 °C (60 to 62 °F). Mean July temperatures range from 20.0 to 21.1 °C (68 to 70 °F). Mean January temperatures range from -6.7 to -3.9 °C (20 to 25 °F). The maximum monthly average daily highs are 25.5 to 28.1 °C (78 to 83 °F). The minimum monthly average daily lows are -11.2 to -7.3 °C (12 to 19 °F). Mean annual precipitation ranges from 850 to 920 mm (33 to 36 in). Prevailing winds pick up moisture from the Great Lakes in the form of lake effect rain and snow showers during fall and winter seasons, and in the form of fog during spring and summer. Thunderstorm intensity is reduced by temperature inversions over the lake during the spring and early summer when lake water is cools the air flowing over it. Average 0 °C (32 °F) frost-free season ranges from 108 to 161 days. Average -2 °C (28 °F) freeze-free season is 141 to 194 days increasing in length from north to south and decreasing in length from the lakeshore inward. Mean annual snowfall ranges from 1.6 to 2.5 m (60 to 100 in). Mean annual extreme minimum temperatures range from -29 to -18.9 °C (-20 to -2 °F), or hardiness zones 4b to 6b.

Table 3. Representative climatic features

Frost-free period (characteristic range)	95-114 days
Freeze-free period (characteristic range)	127-138 days
Precipitation total (characteristic range)	34-35 in
Frost-free period (actual range)	90-121 days
Freeze-free period (actual range)	120-148 days
Precipitation total (actual range)	33-36 in
Frost-free period (average)	105 days
Freeze-free period (average)	133 days
Precipitation total (average)	35 in

Climate stations used

- (1) MONTAGUE 4 NW [USC00205567], Montague, MI
- (2) BALDWIN [USC00200446], Baldwin, MI
- (3) HESPERIA 4 WNW [USC00203769], Hesperia, MI
- (4) MANISTEE 3SE [USC00205065], Manistee, MI
- (5) HART 3 WSW [USC00203632], Hart, MI

Influencing water features

Site subject to seasonal flooding during the growing season, at long enough duration to exclude flood sensitive species. Seasonal high water table generally within the depth of a majority of roots, less that 25 cm.

Soil features

Soils are very poorly drained to poorly drained variable textures that are seasonally flooded. They are commonly classified Mollic Psammaquents, Fluvaquentic Medisaprists, and Typic Medisaprists, and commonly mapped as Glendora, Kerston, and Carlisle series or components. The top 50 cm has a typical pH of 6.6 and is 45% sand and 28% organic matter. At depth, pH ranges up to 6.8, and texture averages 55% sand and 15% clay. Depth to impeded hydraulic conductivity or root restrictive layers averages >200 cm. Depth to carbonates averages >200 cm.

Table 4. Representative soil features

Parent material	(1) Alluvium
Surface texture	(1) Sand (2) Silt (3) Loam
Drainage class	Very poorly drained to poorly drained
Permeability class	Slow to moderately rapid
Soil depth	79 in
Surface fragment cover <=3"	0–1%
Surface fragment cover >3"	0–1%
Available water capacity (0-39.4in)	1.97–9.84 in
Soil reaction (1:1 water) (0-19.7in)	5.5–7
Subsurface fragment volume <=3" (0-59.1in)	0–5%
Subsurface fragment volume >3" (0-59.1in)	0–1%

Ecological dynamics

Wet Floodplain tends to share the same ecological dynamics as Natureserve/Landfire system, Central Interior and Appalachian Floodplain Systems. Stand replacing fires were very rare, with light surface fires occurring every 130-500 years. Frequent flooding may transport nutrients and enhance vegetation growth. Severe flooding may occasionally uproot trees and create canopy openings. Overstory was dominated by flood tolerant species like poplar (Populus spp.) and willow (Salix spp.) in flood scoured areas, and silver maple (*Acer saccharinum*) and green ash (*Fraxinus pennsylvanica*) in stable areas. The wet, relatively high base soils support a productive understory that tolerates moderate periods of inundation. common species include the thicket forming red-osier dogwood (*Cornus sericea*) and the ostrich fern (*Matteuccia struthiopteris*). Warmer areas of this site support spicebush (*Lindera benzoin*).

State and transition model

Ecosystem states

Rangeland health reference sheet

Interpreting Indicators of Rangeland Health is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

Composition (Indicators 10 and 12) based on	Annual Production

Indicators

1. **Number and extent of rills:**

2. **Presence of water flow patterns:**

3. **Number and height of erosional pedestals or terracettes:**

4. **Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground):**

5. **Number of gullies and erosion associated with gullies:**

6. **Extent of wind scoured, blowouts and/or depositional areas:**

7. **Amount of litter movement (describe size and distance expected to travel):**

---

8. **Soil surface (top few mm) resistance to erosion (stability values are averages - most sites will show a range of values):**

---

9. **Soil surface structure and SOM content (include type of structure and A-horizon color and thickness):**

---

10. **Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff:**

---

11. **Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site):**

---

12. **Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):**

    Dominant:

    Sub-dominant:

    Other:

    Additional:

---

13. **Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence):**

---

14. **Average percent litter cover (%) and depth (in):**

---

15. **Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annual-production):**

---

16. **Potential invasive (including noxious) species (native and non-native). List species which BOTH characterize degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not invasive plants. Note that unlike other indicators, we are describing what is NOT expected in the reference state for the ecological site:**

---

17. **Perennial plant reproductive capability:**
